

ABSTRACT

A printer is disclosed for producing rolls of wallpaper. The printer has a frame in which is located a media path which extends from a media loading area to a winding area. A printhead located across the media path.

- 5 One or more input devices are used for capturing operator instructions. A processor accepts operator inputs which are used to configure the printer for producing a particular roll. The winding area is adapted to hold a core and wind onto it, wallpaper produced by the printer, preferably on demand.
